

EXPERIMENT-6

BUILDING AN ANONYMOUS FTP SCANNAR USING PYTHON

AIM:

To develop a python based anonymous FTP scanner using the built-in ftplib module and determine whether an FTP server permits anonymous permits

Requirement:

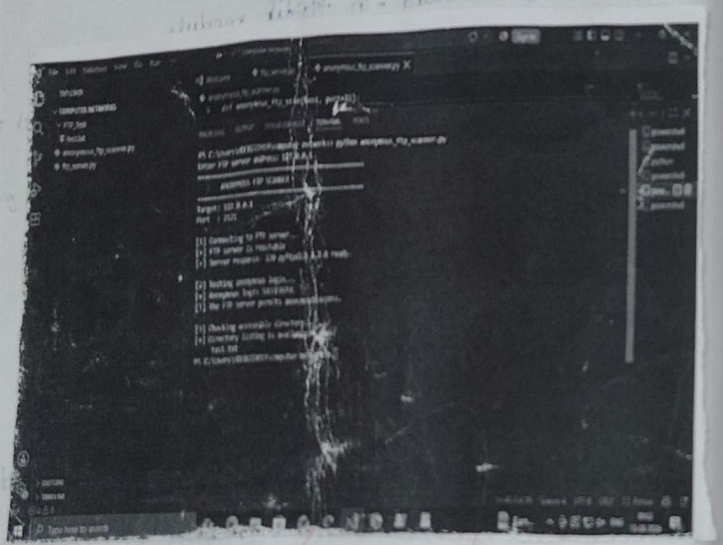

- ★ Window / Linux computer
- ★ Python 3.x
- ★ Python build-in ftplib module
- ★ An FTP server that you are authorized to test
- ★ Internet / Network connection for remote FTP
- ★ No separate installation of ftplib is required

Theory:

FTP (File Transfer protocol) is used to transfer file between computers. Python's Ftplib modules provides function to connect to FTP servers, login, list files and close connection. The scanner attempts to login using the username anonymous.

If successfully the server permits anonymous FTP access

- Import FTP and all-errors from ftplib
- get the FTP server address from the user
- connect to the server using port 21
- Display the server welcome message
- Attempt anonymous login
- If login fails, display the error
- close the FTP connection

Result:

The Anonymous FTP Scanner was successfully implemented. It determines whether the authorized FTP server allows anonymous access and display the accessible files
